

ABSTRACT

A cutter device includes two plier levers pivotally coupled together, and each having a handle section on one end and an operating member on opposite end. The handle section of one of the
5 plier levers includes a chamber to receive one or more spare blades. A handle shell is slidably engaged onto the handle section. A lock device may releasably lock the handle shell to the handle section. A casing is receivable in the handle section to receive the spare blades, and includes a resilient catch to engage through the handle section
10 and to detachably engage and anchor the handle shell to the handle section when the handle shell is engaged onto the handle section.
